Introduction 00000000		1	Hierarchy 000	Test O

Knowledge Representation

Knowledge Engineering Course

Andrea Bonarini

Department of Electronics - Politecnico di Milano http://www.dei.polimi.it/people/bonarini

Academic Year 2010-2011

Introduction ••••••	Knowledge elements	Class 0000	Instance 0000	Property 0000	Hierarchy 000	Test O		
I at la at	and from his							
Let's start from history								

- 1956 Birth of Artificial Intelligence at the Dartmouth College Meeting among phylosophers, psychologists, engineers, computer people
- Sixties Big problems faced: General Problem Solver, Natural Language Interaction, ...
- Seventies First expert systems and real applications
- Eighties Success and delusions
- Nineties Identification of application niches for AI techniques
- XXI Century Agents. AI applications embedded in ICT

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
0000000	0000	0000	0000	0000	000	0

What is a Model?

Class 0000	Instance 0000	1 1 1 1 1 2 1 1 2 1 1 1 2 1 1 1 2 1 1 2 1 1 2 1 1 2 1 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1 2 1	Hierarchy 000	Test O
	0000	0000 0000		

- A representation of something, designed with a purpose
 - it contains the information needed to achieve the goal
 - it is usually compact
 - it is different from the modeled "thing"

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

What is "Knowledge"?

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

What is "Knowledge"?

- data structures
- relationships
- possibility to reason to find new knowledge

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

What is "Knowledge Engineering?"

A set of techniques (methodology) to design and implement Knowledge-Based Systems (KBS)

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

What is "What are KBSs for?"

Many applications:

- Games
- Diagnosis
- Planning
- Control
- Classification
- Machine Learning
- Perception
- Human-Machine Interaction

0000	0000	0000	000	Test O

- Identification of knowledge characteristics and elements
- Symbolic knowledge representation
- Knowledge acquisition
- KBS design

Introduction 00000000	Knowledge elements ●○○○	Class 0000	Instance 0000	Property 0000	Hierarchy 000	Test O
And no	w, a game					

What is a G00237?

You are like a KBS that has to collect information from the external world to understand what is something that at the moment is just named by an internal name: G00237

I'm the external world and I can only answer with "Yes" or "No" or the only specific values that you might understand as a KBS

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

What are the knowledge elements?"

Here are some:

- Classes
- Instances
- Properties
- Relationships and hierarchies
- Inference
- Truth and uncertainty

Introduction	Knowledge elements	Class	Property	Hierarchy	Test
00000000	○○●○	0000	0000	000	O

Design levels

Epistemological aspects

Classes, Instances, Properties, Inference, Uncertanty, ...

Representation techniques

Objects, Logic, Frames, Semantic Networks, Rules, ...

Languages

Prolog, LISP, OPS5, CLIPS, ...

Let's start with the first one and try to frame knowledge so that we can represent it.

Knowledge Representation

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	○○○●	0000	0000	0000	000	O

Terminology

Let's introduce a terminological framework to define knowledge

• Entity

It is anything we would like to represent, either real or imagined, anything we can talk about.

E.g.: Fred, an elephant, walking, Knowledge Representation, the great flight of April 30 2005

• Unit

It is a conceptual data structure we use to collect and frame information about an entity.

We put a # in front of the symbol we use to reference it

E.g.: #Fred, #Elephant, #Walking, #KnowledgeRepresentation,

#TheGreatFlightOfApril30-2005

Slot

It is a data structure that contains the value of a property. We put a \$ in front of the symbol we use to reference it E.g.: \$Color, \$Age, \$StartingTime, \$ReproducesByEggs

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
0000000		●○○○	0000	0000	000	0

The concept of "Class"

A class is a **set** of entities that share some characteristics

E.g.: the class of Ostriches, the class of Events, the class of Engineers

Introduction 00000000	Knowledge elements 0000	Class 0000	Instance 0000	Property 0000	Hierarchy 000	Test O
What is	s a class for?					

- It defines the properties common to a set of entities E.g.: Ostriches are birds, none of them can fly, their height is on average 1.5 meters, ...
- It is used to classify entities E.g.: if we know that something is a bird, cannot fly and its height is more or less 1.50 meters than we can say that it might be an Ostrich
- It makes it possible to make default assumptions
 E.g.: If we know that Fred is an Ostrich, than we can assume by default that it does not fly although it is a bird, ...

Introduction 00000000	Knowledge elements 0000	Class ○○●○	Instance 0000	Property 0000	Hierarchy 000	Test O		
How ca	How can we represent a class?							

A class is an entity, so we can use a unit to represent it

Unit #Ostrich
\$IsA (#Collection)
\$GeneralizedBy (#Bird)
\$SpecializedBy (#AfricanOstrich)
\$Instances (#Fred #Mary)
\$InstProperties ((\$Height 1.50)(\$Flies False))

Introduction 00000000	Knowledge elements	Class	Instance 0000	Property 0000	Hierarchy 000	Test O

Problems about classes

Entity

The only properties that have to be present in all the instances belonging to a class are those defined by conventions (e.g., for triangles NumberOfAngles is 3, Elephants are all mammals, ...) The other properties can be considered as common to most of the instances, and, in any case, characteristic (e.g. elephants have long noses, but an elephant who has lost the nose is still an elephant). For these properties we might assume that instances have *default* values, but if we observe a different value for a given instance, this has to be acceppted (overriding).

Unit

When is it possible to say that an instance belongs to a class?

Introduction 00000000	Knowledge elements 0000	Class 0000	Instance ●○○○	Property 0000	Hierarchy 000	Test O			
The co	The concept of "Instance"								

An instance is an **entity** that belongs to a class

E.g.: Fred the Ostrich, the great flight of April 30 2005, ...

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000		0000	○●○○	0000	000	O

What is an instance for?

- It frames all the properties related to an entity E.g.: Fred is an Ostrich, its height is 1.48 cm, ... the great flight of April 30 2005, is an Event, its type is Flight, its date is "April, 30 2005".
- It belongs to a class

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

How can we represent an instance?

An instance is an entity, so we can use a unit to represent it

Unit #FredTheOstrich \$InstanceOf (#Ostrich) \$Height (1.57) \$Name ("Fred")

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

Problems about instances

Identification

Instances are internally identified by their identifier (#Fred), but it might be described with the same values for their properties, this means that they are identical for the KBS. This might not be a problem, and it depends on applications.

Classification

When is it possible to say that an instance belongs to a class?

Introduction 00000000	Knowledge elements 0000	Class 0000	Instance 0000	Property ●○○○	Hierarchy 000	Test O
The co	ncept of "Pr	oporty	,,,			
The co	incept of Fr	operty				

A property is the minimal chunk of description for an entity

E.g.: the property "height" for ostriches, the property "is a" for the class of ostriches, ...

Introduction 00000000	Knowledge elements 0000	Class 0000	Instance 0000	Property ○●○○	Hierarchy 000	Test O
What is	s a property	for?				

- It identifies the basic knowledge chunk that describes an entity E.g.: Fred is described by its height the fact that is an instance of the class Ostrich, ...
- It is used in any inferential procedure
- It can, in turn, be described by properties E.g.: How much reliable are its values, what are the typical range or the default values, ...

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000	0000	0000	0000	0000	000	0

How can we represent a property?

A property is an entity, so we can use a unit to represent it

Unit #Height
 \$IsA (#Property)
 \$MakesSenseFor (#PhysicalObjects)
 \$EntryIsA (#Measure)
 \$EntryFormat (#SingleEntry)

Introduction 00000000	Knowledge elements 0000	Class 0000	Instance 0000	Property ○○○●	Hierarchy 000	Test O		
Problems about properties								

How can we decide where to put properties?

For instance, let's try to code the knowledge stated as "the fire brigade vehicles are red"

- The property (\$Colour #Red) in the class #FireBrigadeVehicle)
- The property (\$Colour #Red) in the class #FireBrigadeVehicle)
- The class #RedThing of which #FireBrigadeVehicle is a specialization
- The class #RedCar of which #FireBrigadeVehicle is a specialization

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
00000000		0000	0000	0000	●○○	O
The co	ncept of "Hi	erarch	у"			

A **hierarchy** is an ordering relationship among classes according to some property

E.g.: the generalization hierarchy is defined on \$GeneralizedBy, the part-of hierarchy on \$Part-Of, ...

Introduction 00000000	Knowledge elements	Class 0000	Instance 0000	Property 0000	Hierarchy ○●○	Test O		
What is	What is a hierarchy for?							

It implements the inferential mechanism of **inheritance** E.g.: The #Ostrich class inherits from #Birds through the **\$SpecializedBy** hierarchy the fact that their instances have feathers (\$HaveFeathers True) #Fred inherits from #Ostrich all the properties of ostriches through the **\$InstanceOf** hierarchy

#Screw112 inherits from #MyComputer through the hierarchy **\$PartOf** the fact that belongs to #Andrea, as well as #MyComputer

Introduction	Knowledge elements	Class	Instance	Property	Hierarchy	Test
0000000	0000	0000	0000	0000	000	0

Something more about hierarchies

- It is possible to define multiple inheritance E.g.: Ostriches are both Birds and Runners
- The property values are collected from the bottom (Overriding) E.g.: If #Birds has among its \$InstProperties that (\$Flies True), and we define of the specializing #Ostrich class an \$InstProperties as (\$Flies False), then this last will be valid for all instances of# Ostrich (and eventually specializing classes) since they are below in the hierarchy and property values are collected from below

Introduction 00000000	Knowledge elements	Class 0000	Instance 0000	Property 0000	Hierarchy 000	Test •
Test: de	eclarative kr	owled	ge			

Let's represent the knowledge contained in this text Un ingegnere una persona. Aristide un ingegnere. Gli ingegneri sono laureati. Aristide si laureato il 20 luglio 2005. Ad Aristide piace ballare. Agli ingegneri piace il computer e non piace ballare.

- An engineer is a person
- Aristides is an engineer
- Engineers have a master degree
- Aristides got its degree on July, 25 2009
- Aristides likes dancing
- Engineers like computers and do not like dancing
